Dear pandaRooters,

I have added a new particle generator "PndFlatParticleGenerator" to the development branch pgenerators_TS. It shoots one particle into a given angular segment and steps in the next event to the next segment. In addition it can vary from one event to the next the momentum of the generated particle.

It is a modification of the PndBoxGenerator. So all methods available for this generator can be used for PndFlatParticleGenerator, too.

Please feel free to test it.

Cheers,

Tobias
