I never understood why it need SQL? in fact it does not but the the library is linked there in the config.mk, so please remove it from there! if you are using g77 then that is it, otherwise you have to remove also the libg2c and replace it with libgfortran.

I changed locally the default link options in the configure script omitting ISQL, and EvtGen can be linked. I did not test whether it still works with the ROOT version in the july09 external packages.

Bye,
Olaf.
