Dear all,

as planned in the very old tracking meeting in Ferrara, I have created a folder GenfitTools/recohits, to store all the reco hits from all the detectors. In this case, we will be able to remove the genfit dependency from all the detector libraries.

I have started from MDT, it would be nice if all the detectors would move the reco hits there, as planned years ago, and remove this dependency. In this case, one should only load libRecoHits to have the recohit stuff working. The folder is in "write access" to everybody.

The second step will be to have another folder there with only one kalman task, to remove all the sub-kalman tasks in all the detector folders, for a better structuring of the code.

Regards
