Hi Christian,

yes, yes, we know. We have that as homework in the technical informatics class (printf "Schalke wird Meister" or something by signal catching when typing CTRL-C ...), but: how to do this in a root macro? There is one similar posted question in roottalk, but it seems it was not answered. Also, in the PndPidCorrelator one has no access anymore to an event counter (it is just hidden from the user) so we wouldn't know how to jump to the next event in the signal handler.

Martin is trying right now to find the event for which it crashes. Maybe we can finally see, why (why should a radiated photon crash the Geane for the propagation of the charged track from which it was radiated?)

cheers, Soeren
