Dear christian,

i have already tested the RKTrackRep

by the time you have introduced it by the first time in genfit package, but the result was a little bit strange, maybe i should try again with the new revision .

I know that to track pions in momentum range of 80-150 MeV/c
(that have been already done by the AGS -E906 collaboration but
with drift chambers and not with silicon detectors) can be
hard, but i think it is a exciting challenge to be solved.

I'm really glad to follow your (and pavia group) advances concerning the genfit + geane ;).

best regards

Alicia S.
