Dear christian,

i have already tested the RKTrackRep

by the time you have introduced it by the first time in genfit package, but the result was a little bit strange, maybe i should try again with the new revision .

I know that to track pions in momentum range of 80-150 Mev/c (that have been alreday done by the AGS -E906 collaboration but with drift chambers and not with silicon detectors) can be hard, but i think it is a exciting challenge to be solved.

I'm really glad to follow your (and pavia group) advances concerning the genfit + geane; ).

best regards Alicia S.
