Hi Sebastian, yes, I was just about writing the same!!

I completely agree that it is important to keep these events in.

This is real background which will occur in data taking as well.

I actually think this might Bremsstrahlung in the detector material, beampipe or TPC gas (by Geant) with $\gamma \rightarrow e^+e^-$ and then curling $e^+/-$.

I suspect so because it seems to occur more often in $J/\Psi \rightarrow e^+e^-$ (about 1/1000 events) than in $J/\Psi \rightarrow \mu^+\mu^-$

(rough estimate is $\sim 1/10000$ events or even less).

cheers, Soeren
