Hi Anastasia,

nice to hear that the misterious behaviour has an explanation!

Changing the precision of input variables of GEANE is not so straighforward, but you could try to register the MC point on the LUMI exactly on the surface by changing the value of EPSIL (i.e. boundary crossing precision) in the media file:

You can try running a simulation with a smaller value, e.g. 0.0001. It slows down the simulation but should find the surface more precisely and then GEANE should start from a more correct position.

Cheers, Lia.
