Hi,

I have added `#include <cstdlib>` to `PndEmcErrorMatrix.h` but I cannot check by myselfe if it eliminates error, since I didn't have it.

Concerning the question of using `abort()` at all, I do not insist on it. I put it to catch unexpected run-time behaviour and would like to avoid complicated exception handling. Suggestions about better alternatives will be accepted.

In addition I have added root files with parameters

`input/emc_error_matrix_default.root`

`input/emc_error_matrix_1.root`

Best regards,

Dima
