Felix Boehmer wrote on Mon, 20 December 2010 19:17: Dear Stefano,

let's try to be a little more constructive. The "Symbol___G exception" hints towards an uncaught system signal, most likely a bad alloc. Memory load seems to be the most likely reason for these crashes.

The error comes from FairRootmanager, when trying to read (ReadEvent) or filling (ForceFill) a Tree. It is the TTree command the one who gives the exception which is not caught. This means that the data saved in the tree, or which are going to be saved, are somehow corrupted. Discussing with Mohammad, a missing empty constructor/destructor or some not initialized data member could be the cause, but as I was not able to find such a case in a glance. Maybe there is something else.

But let me repeat the question: have you tried and succeed running 10k dpm events? As far as I know this problem appears in Torino, at GSI and also in Bonn.
