Dear colleagues,

as announced already in the EVO meeting today, I have redesigned the storage of the FairLinks in the Tree. This work has reached a stage where it has to be tested by other users. Especially if the TPC digitization problems still exist and how the memory consumption develops during a simulation.

The new FairLinks work for MVD, TPC and Lhe. For all other detectors the dependence of FairMultiLinkedData has been removed.

The files can be found in the development branch of pandaRoot in the branch FairExtLink_TS. It contains a full pandaRoot installation.

I wish you all a Merry Christmas and a Happy New Year.

Cheers,

Tobias
