Dear colleagues,

I am a new user of pandaroot starting to work on the EMC FwEndCap. I was wondering how I can make use of the FairBoxGenerator to generate ions and particles with undefined pdg codes like alpha, triton,.... I've already tried the following method for a few ions:
 $\text{pdg} = 10000000000 + 10000 * z + 10 * a$

But apparently it only works for alpha, triton, 3He and 4He. However, it doesn't work, for instance, for 179Au (using $\text{pdg}=1000791970$)

Do you think if I'm using a not valid method to generate heavy ions and even light ones like alpha?
