Hi Oliver,

thanks for the check.

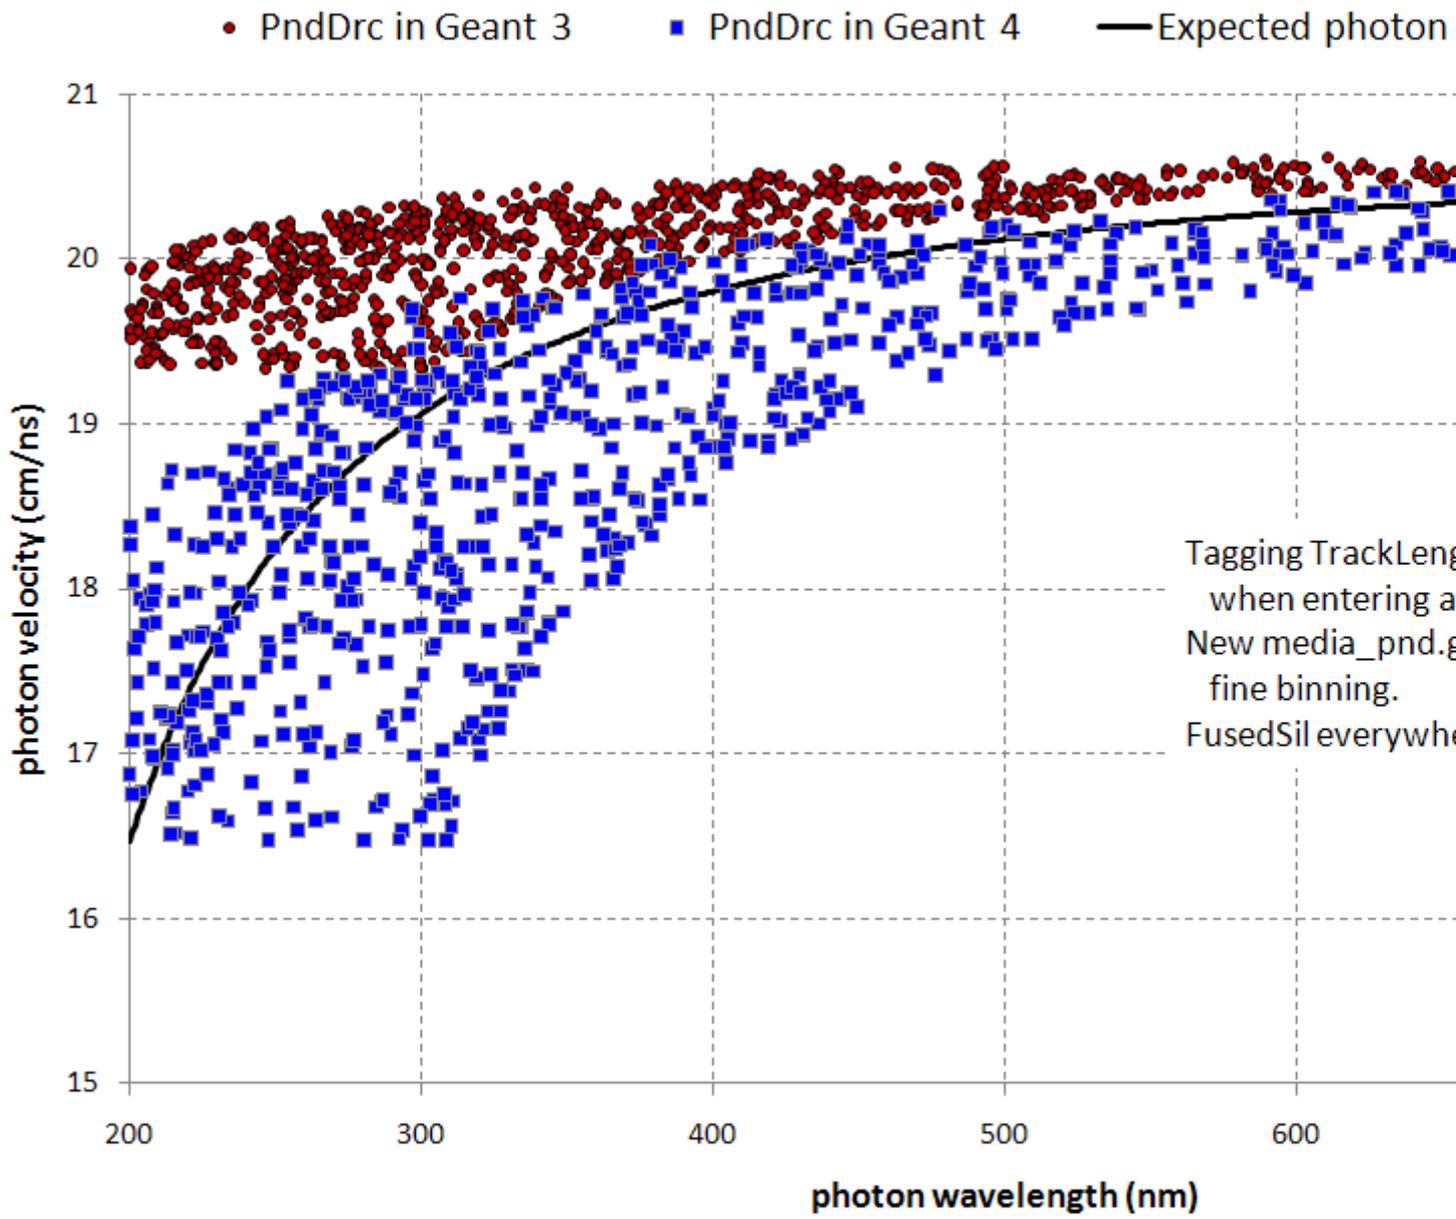

Are you plotting the average velocity per wavelength bin or the velocity for each photon? In the events that I looked at the velocity is almost correct on average but there is a huge spread. Would it be possible for you to plot the velocity per photon vs. the photon wavelength from your sample, similar to the scatter plots I have?

I checked the material properties table for FusedSil in the current official media_pnd.geo and it looks OK. The binning could be finer and I applied a table with the equivalent of the 1nm binning you recommended. The spread of v_{group} for a given wavelength remains the same, as you can see in the attached plot for the finely binned FusedSil.

Cheers,
Jochen
