Dear all tracking developers,

I would like to ask you which will be the official code we have to run for the grid massive data production.

As far as I have understood, many "open points" of my slides are already fixed or they are going to be fixed soon. For this reason I ask you here which tasks we have to use exactly for data production, for digitization, for the event mixing, for the MVD+CT+GEM global tracking and for the  $dE/dx$ .

Please write here when the code is in svn, when you are ready, so that we can start at least to run some tests.
