Hi Felix,

in such a case like what you describe,

1. Create a FairRunAna
2. The geometry is simply introduced via:

```
void FairRunAna::SetGeomFile(const char* GeoFileName)
```

3. Do not set any input file.
4. You should introduce a task that read your input tree, or list mode file. (This task should be added as first one in the list)
5. then you run normally

regards

Mohammad
