Dear PandaRoot developers and users,

To run your updated code on the grid, please take a look at how we did it during the last round

<http://panda-wiki.gsi.de/cgi-bin/view/Computing/DataChallenge4>

and then prepare your macros, shell scripts and JDLs. I suggest creating a new wiki page for this, so that we have a central resource.

I will review the macros, shell scripts and JDLs before running a test, then we will run a small batch together, then run the whole production.

Since very few PANDA institutes contributed decent (if any) resources to the grid, we depend on shared CPUs, so the number of jobs we can run at a given time depends on how busy these shared resources will be.

Please give attention to how you handle stdout, stderr, and exit codes to be relevant, because no one can babysit thousands of jobs.

Cheers,
Dan
