Hi Gianluigi,

Indeed the constructor

```
PndSttMvdTracking * SttMvdTracking = new PndSttMvdTracking(0, false, true);
```

was used.

And it was used all the time before and before the recent update it didn't cause any problem.

As I understood the data produced with the last flag set true are valid. Only in addition track association with MC tracks is performed. But I suppose that macro which produce data on GRID have the same constructor and similar problem is possible.

Dima
