Hi,

I'm simulating the decay $X(3872)$ to $\mu^+\mu^- \pi^+\pi^-$ in the final state. But I observe a strange behaviour for EvtGenDirect and Geant3. Instead of 4 particles in the final state Geant tells me that I gets 6 particles from EvtGen. These particles seem to be additional muons with $p=7\text{Gev}/c$ and $\Theta=\Phi=0$.

If I use EvtGen to create a output.evt and use this for the simulation everything looks fine. I attaced the decay file, simulation macro and some plots.

I use PandaRoot 11145 and Fairsoft may.

Cheers,
Tobias
