Subject: cdash changes: update your nightly builds!

Dear all,

As was announced last week during the pandaroot meeting, there will be a change in the usage of cdash (starting tomorrow): there is now a common script (Dart.sh) that reads in an external (defined by you) configuration file containing the site specific information. The corresponding configuration file is given as second argument in the call of Darth.sh. An example configuration file is attached to this forum message. For those running nightly builds, please modify your crontab accordingly. Your new crontab line should look like:

15 1 * * * /misc/uhlig/SVN/ctest/cbmroot/Dart.sh Nightly
/misc/uhlig/SVN/ctest/cbmroot/Dart_cbm_etch64_jan10.cfg

(of course with the proper paths and configuration file name)

Greets,

Johan (with thanks to Florian).
