Ah sorry, I haven't read this.

But I just fixed a little bug in the MVD correlator Task, there the RKTrackRep was not correctly copied and just GeaneTrackRep was used.

And I just tested with RK as cardinal Rep and there efficiencies seem to go up.

I just committed a new version of the RiemannTrackingTask, where Geane is no longer set as cardinal rep.

Dear Analysers, could you please check the efficiencies with the new versions?

regards,

Johannes
