Hi,

For my ppbar->X(3872)->J/Psi pi+pi- I want to use some decay models from EvtGen. In order to do this I added the following line to evt.pdl

add p Meson X3872 59 3.872 0.0001 1.0 0 2 0 0

and made some changes to my decay file. When I now run a simulation I get lines like these from the monte carlo.

EvtGen:prob > probmax:(0.11882>0.08)(VVPIPI) X3872 -> J/psi pi+ pi-

But all events seem to be propageted by Geant.

Could someone tell me what this warning means and what I am doing wrong.

Cheers, Tobias
