Dear pandarooters,

in the course of our event mixing studies, we changed the place where GFTracks are created.

This has been done in the RiemannTrackingTask.

Now there are only PndTpcRiemannTracks created, and then, in the PndTpcTrackInitTask, GFTracks are created from RiemannTracks.

I already modified all reco macros and introduced the new task there, so everything should work fine.

Notice that old macros without the PndTpcTrackInitTask will not work anymore (probably the KalmanTask will complain with "track-array not found!")

Regards,

Johannes
