Hi Lars,

So now I'm clear(?), the reconstructed tracks, specially in STT mode,
I have to check whether tracks are passing through the STT physical volume or not, explicitly.

Then it means that technically I can require at least one hit on STT, which must be revealed in the defined tracklet of psi product, otherwise STT didn't join to tracking stage.
If it so, that is easy to handle it. Those events will be easily rejected.

But if you meant some test volume itself, I have to think about it. How can be done...

If there some other clever or efficient way to do that, please let me know.

Cheers,
Donghee
