Dear panda family,

I would like to show you very small study for lambda-lambdabar decay channel.

I have a look the data run994 with tpc mode on pandagrid.

I found that the global efficiency (for very ideal case) can be achieved around 12%, probably decay topology looks quite promising.

But the momentum, vertex and theta resolution looks not so perfect.

Please have a look this lambdabar-lambda study, and need some comments from you...

Best wishes, Dognhee
