As we can see BR ratio in the pole is OK.
Also $d\Gamma/dM$ is working fine.

I put distributions of Delta mass drawn for 1mln generated events directly from this macro (not in Log Scale).

This looks nice.

But for mas of (proton $e^+ e^-$) one can see

Question is: How large should be statistic to get smooth shape of Delta tail? Because 1 mln is not enough as we can see.

By the way i thought that main goal to use flat gen was to make tail smoother. Do we have reversed result?

e^+e^- invariant mass looks quite smoothly.
