Hi Ingo

In the same way as previouly i made several test.

I used same macro as you send me to simulate D+ but this time ND13+ (N*1520) was simulated (macro in attachment).

Here are results:

Mass of Delta

Mass of pee

Ratio means BR

One can see that:

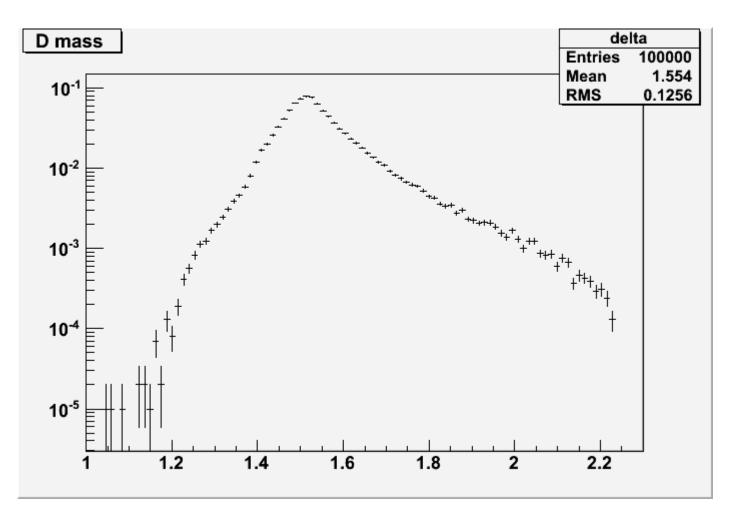

- shapes are ok
- BR ratio in pole is same as expected (0.0051/137=3.7e-5)

Commend [ND13+_dalitz] dgdm from Zetenyi/Wolf {/} is displayed while processing but weight is constant

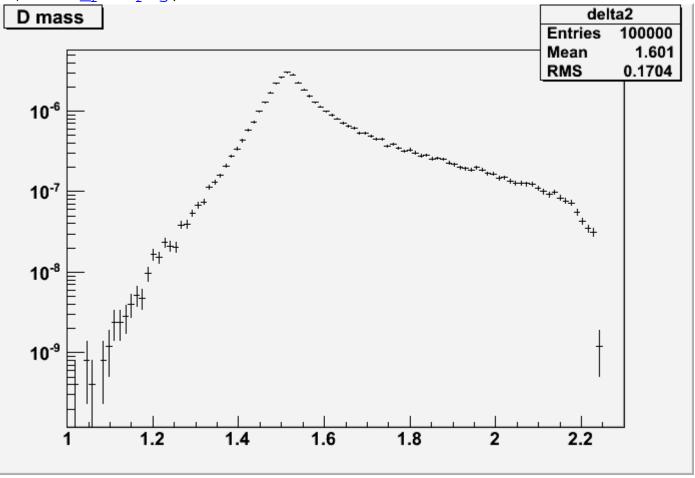

Does it means that dGamma/dM working or not?
