hello,

I investigated the discrepancy in efficiency in the Eta_c channel when using the july11 release or the latest trunk version. (pandaroot/macro/run/tdrct/eta_c directory).

In my opinion the problem is in the generation/digitization of the Eta_c events.

In fact, when I use the events generated and digitized (i.e. the evt_points_stt.root and evt_params_stt.root and evt_digi_stt.root files) with the july11 libraries AND I ANALYSE THEM WITH THE CURRENT TRUNK REVISION I obtain the same Eta_c plots obtained when I ANALYSE THE SAME EVENTS WITH THE july11 VERSION OF THE CODE.

Please look at the attachment plots : trunk.pdf is when the analysis is done with trunk, july11.pdf when I use the july11 library.

Gianluigi
