Hello everybody,

here you can find the results also of $\pi^+\pi^-\pi^+\pi^-$ with event mixing.
I reported both $\pi^+\pi^-$ and $2(\pi^+\pi^-)$ channel.

As you can see in slide number 11, for the invariant mass of the four pions, the background level is huge, and so I think that one solution could be to fit the distribution with a gaussian function plus a polynomial function in order to take into account the background level.
In this way I calculated the efficiency as number of signal events/ number of generated events, and the result is 13% against 30% without event mixing.

For the two pions channel we have a drop in efficiency from 69% to 60%.

Elisa
