Hi Raghav,

the problem comes due to the fact that we introduced some new classes for data base handling. This classes are compiled in a new Library libFairDB. We did the changes in the main CMakeLists.txt for all our projects, but forgot to change it in fairbase. I correct now the file and changed also the macros. If you have your own macros please add also a line loading the new library. As an example you can check one of the macros which are in the examples directory.

Please do a "svn update" in your source directory and then it should work again.

Sorry for the inconvenience.

Ciao

Florian
