I believe it is inside those overlaps. Checking the full geometry takes a lot of time, I launched the check yesterday evening and this morning it had not finished yet, and I had to stop it. This check should be done detector by detector, to be more efficient.

However, I am surprised to see those overlaps in ms. I had studied the solenoid some time ago and there was only something in the cryostat, discussed with Tobias who produced such file and it was not giving us problems. But I do not remember strange overlaps where now they are appearing...
