Hi Florian

Ahh i see.

So i actually need a set of classes for every detector that i have that does digitization like what panda has. I will try to implement those by today.

Quote:

This you can do in a first step with a simple smearing of the MCPoint, where you probably don't need parameters from a parameter file. You can simply hard code them. If you then have a running chain you can identify the parameters in the task and the create a parameter file which contain the needed information.

I am doubtful on this part where you say that i can hard code some parameter for a simple smear. Is it done somewhere before because i am pretty new to this and i am not sure how to go about doing it.

So right now i will focus on getting the digi file to work and then i will concentrate on getting the right parameters to work with.

Thanks again
Cheers
Raghav
