Hi Florian,

You are correct;), there was different version of gfortran used to compile externals and pandaroot.

Check the original post by Maria - she installed xcode with gfortran and using these installed Jan12 external packages. However pandaroot installation crashed. Mohammad suggested downloading gfortran which we did (version for snow leopard). We copied the files to /usr/local/ and so we got gfortran version 3.4.0.  
But this is still producing errors as you can see.

yours  
radek
