Hi everybody,

I finally could compile PandaRoot and the macros work.

I tried to install everything from the beggining yesterday.
I checked twice that the path was set before correctly to the directory with the external packages, but it still didn't work.

Finally today I tried to install everything again from the beggining. The only difference is that this time I didn't set a directory for installing the binaries. So, it seems that the problem is somewhere there. So, I compiled the external packages without problem and then PandaRoot also without errors.

With the help of Dmitry, I just run the macro called "run_sim_stt_evt.C"

Although I don't understand yet what the macro does, it seems that everything finally works.

Thanks a lot for your help, suggestions, and time.
See you on Monday!

Mamen
