Subject: problem running reco macro with the july12 release

Hi,

I checked out and compiled the jul12 release of pandaroot (revision 16335) on my local machine (Ubuntu 12.04). This worked fine except that I had to check out the geant3 libraries separately (does that matter?).

I also managed to run the tasks in pandaroot/tutorials/feb12 (from generation/transport to analysis) for 100 events which worked fine. However, when trying 1000 events, the reco task crashed after 257 events. The log (with verbose mode 1) is in the attached file. My colleague does not reproduce this crash (the only difference, as far as I can see, is that her machine is Ubuntu 10.04). Does anybody have an idea about what the reason for the crash could be and what I could do about it?

Kindest regards,
/Karin
