Yes this error occurs with all macros that I use for PLUTO.

libPluto.dylib was a dynamic link created by the .sh script used to build PLUTO.

The makefile that comes with PLUTO does not work for Mac OS X.
So what I noticed was that there was a path for a PLUTO installation in the HADES simulation installation package. I modified that script to install PLUTO on Mac OS X.
PLUTO installed correctly without errors, so I am assuming the script worked.

I am attaching the scripts. All that needs to be run is configure.sh
