That is a strict caveat considering that there might be a situation in which the cross section for set of beam energy & c.m.  $\cos(\theta)$  is greater than another beam energy in c.m.  $\cos(\theta)$ .

If each TGraph was normalized to 1, then the cross section generated would be flat in beam energy but not  $\cos(\theta)$  c.m.

I am attaching a plot I generated showing the cross section of eta in photoproduction in plots of beam energy. Y axis is cross section, x axis is  $\cos(\theta)$  c.m.

Otherwise, the idea you sent before would be outstanding.
