Ingo,

Thanks for the update. I wanted to inform you that I have revised my method of simulating with cross section information by use of your advise by using similar methods to elementary plugin.

I get a strange behavior though,

If I ran the attached macro 100 times, it will produce two different beam profiles 50/50.

I have attached what each beam profile is generated at.

I had not see this behavior before when I was just weighting the beam.

It appears that the t-slope generated the same for both of these beam profiles.

Thoughts?

Thanks

Michael
