Quote:

One can easily play with it already before the event loop by adding the following line in PScatterCrossSection.h:

```
PF2EvalBatch *GetFunction(void) {return pf2;};
```

When I add that line into the .h file, I get the error

```
Error: Can't call PScatterCrossSection::GetFunction() in current scope
```

```
Draw_q_cstheta.C:206:
```

```
Possible candidates are...
```

```
(in PScatterCrossSection)
```

```
(in PAngularDistribution)
```

```
(in PDistribution)
```

```
(in TF1)
```

```
(in TFormula)
```

```
Error: non class,struct,union object GetFunction() used with . or -> Draw_q_cstheta.C:206:
```

```
*** Interpreter error recovered ***
```

I placed that line into the protected section of the .h file.

I also placed it in the public, but still did not work.

Also, what would linear interpolation do? I would think with the histograms fitted and filled to be smooth, further interpolation would not be needed.
