Subject: DPM weird t spectrum (random problem)

Hi,

I'm obtaining very strange data, when using the standalone version of DPM (settings: tmin 0.025 degrees, only the elastic part).
I attached two plots showing this. Both show the -t distribution. dpmprob-125binning shows the distribution with a binning of 125, because the effect is the most dramatic in this case. For dpmprob-400binning a few single outliers are present...

Am I missing something?

Best regards,

Stefan
