---

Also, has anyone had any luck using geant4 with the current fairbase?

I tried running the rutherford example,  
cd fairbase/examples/rutherford/macros  
root run\_rutherford.C  
And it seemed to run without a hitch.

However, run\_rutherford as it is in the repository uses Geant3. I want to use Geant4, so I replace run->SetName("TGeant3"); with run->SetName("TGeant4");  
After I try to run\_rutherford.C again, I get a segmentation fault. The error is described in geant4SegFault.txt. I naively copied g4libs.C from sep12/transport/geant4\_vmc into my sep12-build/share/root/macros and into my gconfig folder in my fairbase. Note: the g4libs.C was not found at all in my sep12 build folder, which might suggest that sep12 is faulty in this aspect. After copying g4libs.C into said folders, I ran rutherford again and obtained the error described in geant4now.txt. I don't know what else to try, so any help is greatly appreciated.

Thank you in advance
