Subject: getting run\_rutherford to calculate eta parameter [SOLVED]

---

Hi all,

I would like to request help in modifying fairroot to give me information about  $\eta = -\log(\tan(\theta/2))$ , which is a very common parameter for understanding detector physics. Moreover, I think it should calculate eta by default, in the same way that it calculates phi and theta by default.

To give more background:

The way fairbase is in the repository, if you do

`root fairroot/examples/rutherford/macros/run_rutherford.C`

the output is contained in `fairroot/examples/rutherford/macros/data/test.mc.root`.

If I open the root file

`root data/test.mc.root`

TBrowser j

Then you will see the attached image. I would like to modify fairroot to include information about eta as one of the leaves of FairRutherfordPoint. Can someone tell me how to do that? Would I need to make changes to FairRutherfordPoint? FairMCPoint? etc...

I hope I'm making myself clear. All help is greatly appreciated

-Raphael
