Subject: Problem with PndKinVtxFitter and Ks decays

Dear all,

I've come across a problem while trying to reconstruct the following decay:
  D0 -> Ks pi+ pi-, Ks -> pi+ pi-

The procedure I use is to first use PndKinVtxFitter to fit the pi+ pi- from the Ks decay to a
common vertex, and then use PndKinVtxFitter to combine the fitted Ks with another pi+ pi-
pair, to reconstruct the D0. The problem is that the fit to the D0 -> Ks pi+ pi- always returns
nan for the chi^2.

The fitting code I use is exactly analogous to that used by Marius to reconstruct psi(3770) ->
D+ D-, D+- -> K+- pi+ pi-, and we think that the problem is due to PndKinVtxFitter not being
able to properly handle the neutral Ks candidate.

I've attached the analysis code and EvtGen decay file that I used for this analysis.

Best,
Sean
