Hi Stefano,

If I do not need to have any trained data then I should just play with the macro's, since the classification functions are built as a library in PANDARoot and can load from standard place (under buildpanda), as you mentioned.

But I don't have trained data and have to do myself for my data sample in my understanding. I learned that in PndTools/MVA/build one can find some classifying tools as a binary executable to prepare such training. Therefore I tried to make this part.

Is there some way to get trained data from standard build location? If yes, it would be really great and will try with them.

Best wishes,
Donghee
