I did, but the structure is still the same. SIMPATH in config.sh is correct, but the geant4 libraries, for example, are in the wrong place.

Example:

```
-----
export Linux_Flavour_="Ubuntu 12.04 LTS n l"
export System_="x86_64"
source /export/home/schonnin/panda/pandaroot/buildPanda/check_system.sh

if [ "$same_system" == "1" ]; then
  export SIMPATH="/export/home/schonnin/panda/sep12/build"
  export ROOTSYS="/export/home/schonnin/panda/sep12/build"
  if (true); then
    export GEANT4_LIBRARY_DIR="/export/home/schonnin/panda/sep12/transport/geant4/lib "
  fi
fi
etc.
-----
```

There is however no directory /export/home/schonnin/panda/sep12/transport/geant4/lib ,instead the geant4 libraries are in /export/home/schonnin/panda/sep12/build/lib

I did not have this problem with the previous external packages and then, as as I remember, one did not have to specify a special installation directory during configuration.
