
Subject: Small positive chi2 values in PndKinFitter

Dear all,

In the simulation (#18621) of $\bar{p} p \rightarrow D_s^+ D_s^-$; $D_s^- \rightarrow K^+ K^- \pi^-$; $D_s^+ \rightarrow \eta e^+ \nu_e$; $\eta \rightarrow \pi^+ \pi^- \pi^0$, I did the mass constraint fitting to the π^0 candidates with PndKinFitter. All the chi2s are pretty small with the mean value of ~ 0.001 . This also happens in the case of η .

I noticed the previous topic discussed by Albrecht about the negative and extremely small chi2 in PndKinVtxFitter.

<https://forum.gsi.de/index.php?t=tree&th=3385&start=0&rid=1979&S=7cee6febef5676d17dc9e3154e1269e2>

Considering the formula for chi2, the small values may be due to a large sigma in the denominator.

Does anybody have some solutions or hints to improve it?
or is there any way else to understand this problem?

Thanks in advance.
