Subject: Still some problems

Hi Mohammad,

thanks for the quick help! I tried with the fairbase trunk, but still have some problems.

When I now set a geometry file to run_ana, it seems to work (see log_with_geofile), although there is a strange error message in the initialisation of FairBaseParSet:

Quote:***
   initialisation for run id 1370260005
****
-I- FairRunTimeDB::InitContainer() FairBaseParSet
Error in <TBufferFile::ReadClass>: got wrong class: TGeoManager
Error in <TBufferFile::ReadObject>: got object of wrong class! requested TObjArray but got TGeoManager
Error in <TBufferFile::CheckByteCount>: object of class FairBaseParSet read too few bytes: 69750 instead of 69833
Container FairBaseParSet initialized from ROOT file.

When, however, I try to run without explicitly specifying a geometry file, the program crashes (see log_without_geofile.txt).
