Dear all,
  I wonder to know (1) whether the existed implementation of EMC reconstruction associate charged tracks with showers? (2)
after a full reconstruction for all sub-detectros, whether PndTrack is the only interface to access all tracks, both charged and neutral ones? (3) under time-based simulation, how to organize these tasks together to reconstruct tracks using time information?

BTW, at present, within time-based framework, only implementation for photons has been done.
