Dear All,  
after the last modification of the PndChiVtxFitter.cxx  
these are the main results that I got.  
Resolution on x: 32 micron

Resolution on y: 54 micron, why is it different from x?

Resolution on z: 113 micron.

Chi2 still some negative values: do you have suggestions on how to decide what is the best candidate in case of combinatorials?

Mass of the D0 before and after the fit: after the fit we got a low number of D0 under the central peak

Best regards,  
Laura
