Hi, concerning the beam pipe:

I attached an updated version, but the beam pipe is even larger. I find internal overlaps even more interesting. How do I check those?

I wanted to wait for some decisions to be taken from the CAD integration side, like what happens to the pumps upstream of the dipole, but I'm afraid that we should insert simply the current beam pipe description. I see that many people realize that their detectors do not fit only from the detector description in pandaroot. Decisions about beam pipe enlargement are already approved by the technical board.
