Hi Stefano and Klaus,

thank you to answer to my question. As I am a beginner in using Pandaroot, I don't know since which age this problem is known. I just found it in the new release. I am sure that in the next release it will be fixed, because it can generate confusion when one gets started. I see also that the sim-macro becomes slower and slower, depends on how many events I try to simulate. Is this a known problem, too?

Thank you again, Elisabetta
